All projects are required to submit a project reports through the EEE Dropbox submission system.

The project report should consist of the following sections:

(1) The key objective that the project is aiming to address and proposed work (you can use and revise the material from the original project proposal as appropriate)

(2) Related efforts (research, products, deployments) -- include your project survey material as appropriate.

(3) Approach, methods and techniques used/developed/implemented in the project (e.g. frameworks, algorithms, simulation platforms or techniques used)

(4) Evaluation plan and evaluation results (experiments conducted and experimental results obtained through measurement/simulation studies for example) and an analysis of the results. This section can include implementation issues faced and how they were resolved.

(5) Conclusions and possible extensions to this project

Also, please submit code developed as a part of this project (this code may be handed over to project teams in future classes as a starting point unless you object).
